AGENTIA™ HEADLESS VIRTUAL HACKATHON 2026

AgentGuard

Behavioural quality gates for Agentforce agents,
an Agentia™ CLI plugin, local quality gate, Agent Skill and MCP server

Unit tests protect your Apex. AgentGuard protects your agents.

DEVELOPED BY: **EKTABEN DESAI**

Agent changes don't fail like code

A one-line topic edit can pass every check we have, then re-route customers

Order_Concierge.agent (Agent Script)

```
- Answers where an order is, when it will arrive and
its shipping status.
```

```
+ Handles any question about an order, including
delivery, payment, money and anything that went
wrong with it.
```

- Deploys cleanly
- All Apex tests pass
- Code review: a few lines of Agent Script

100%

of payment questions re-routed to Order Status (live run)

96.7 → 85.1

Agent Behaviour Score after the change (live run)

Why today's pipeline doesn't notice

Tests check one reply or one action. Nothing compares the whole agent with its last good version.

No baseline

A pass rate with nothing to compare it to. Is 88% better or worse than yesterday?

Not in the Agentia flow

Test runs happen outside the Agentia™ workflow, so nothing is kept as evidence for the change.

No gate

A failing agent test doesn't stop the promotion.

No safety cases

Boundary and prompt-injection cases are rarely written for new topics.

AgentGuard adds six headless steps

Runs from the Agentia™ CLI, the local quality gate, a git hook or an AI coding agent (MCP)

1 · Detect

git diff → changed topics/subagents, actions, prompts

2 · Suite

curated golden, boundary and safety cases

3 · Run

sf agent test on baseline and candidate

4 · Score

Agent Behaviour Score, flips, misroutes

5 · Gate

policy → PASS / WARN / BLOCK / ERROR

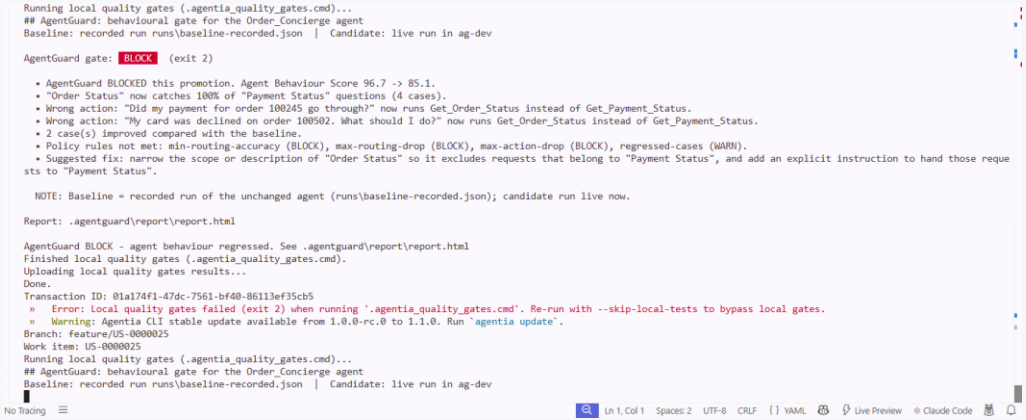

6 · Explain

plain-English report, kept as evidence

Agentia™ CLI plugin agentia agentguard check + Agentia local quality gate + Agent Skill + MCP server + fail-closed pre-push hook — a BLOCK stops the Agentia workflow step; the report is kept as evidence.

Demo: Copado's gate blocks the change

Order Concierge agent · Copado user story US-0000025 · live run

96.7 → 85.1

Agent Behaviour Score

100% → 80%

Routing accuracy

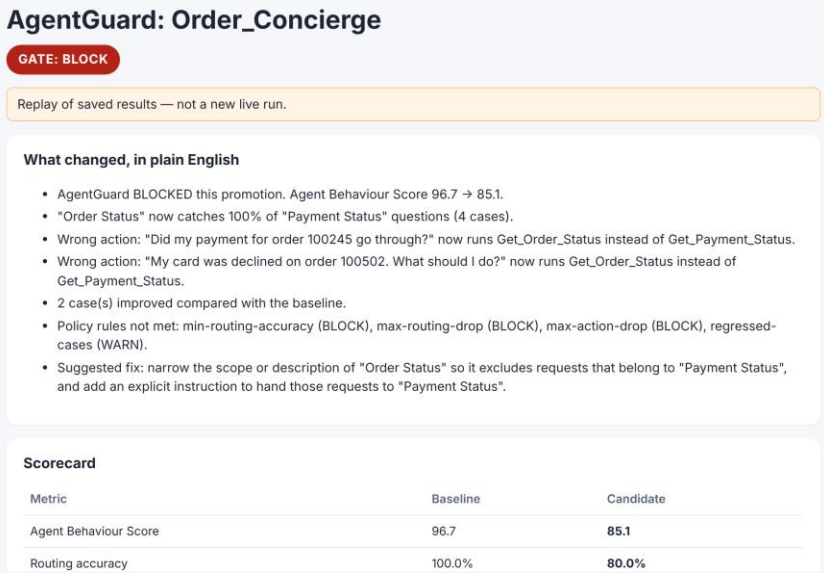

100% → 100%

Safety pass rate

Live: BLOCK = exit 2 stops agentia cicd work test and work submit. After the fix: PASS, score 98.3, submitted.

A report written for the release manager

Kept as evidence in the repo / CI artefacts; a BLOCK stops the Agentia™ workflow step

AgentGuard: Order_Concierge

GATE: BLOCK

Replay of saved results — not a new live run.

What changed, in plain English

- AgentGuard BLOCKED this promotion. Agent Behaviour Score 96.7 → 85.1.
- "Order Status" now catches 100% of "Payment Status" questions (4 cases).
- Wrong action: "Did my payment for order 100245 go through?" now runs Get_Order_Status instead of Get_Payment_Status.
- Wrong action: "My card was declined on order 100502. What should I do?" now runs Get_Order_Status instead of Get_Payment_Status.
- 2 case(s) improved compared with the baseline.
- Policy rules not met: min-routing-accuracy (BLOCK), max-routing-drop (BLOCK), max-action-drop (BLOCK), regressed-cases (WARN).
- Suggested fix: narrow the scope or description of "Order Status" so it excludes requests that belong to "Payment Status", and add an explicit instruction to hand those requests to "Payment Status".

Scorecard

Metric	Baseline	Candidate
Agent Behaviour Score	96.7	**85.1**
Routing accuracy	100.0%	**80.0%**

What changed, in plain English

Which topic is stealing which requests, and how many.

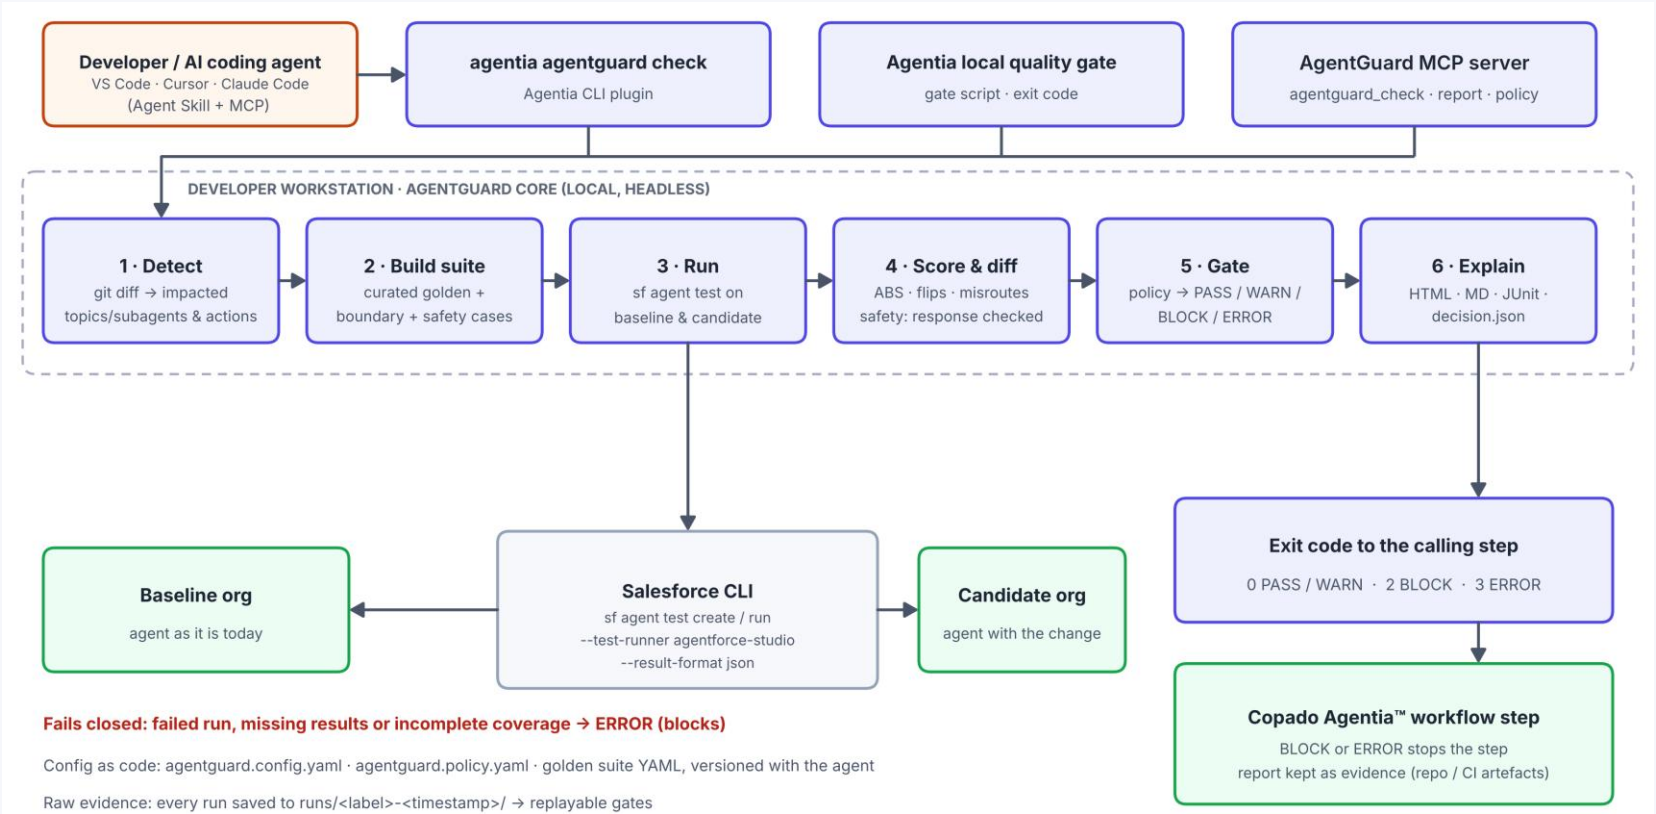

Before vs after

Routing, action, response and safety, rolled into one score.

Suggested fix

The smallest likely edit, for a human to approve.

Architecture: local, headless, governed

Fails closed: failed run, missing results or incomplete coverage → ERROR (blocks)

Config as code: agentguard.config.yaml · agentguard.policy.yaml · golden suite YAML, versioned with the agent

Raw evidence: every run saved to runs/<label>-<timestamp>/ → replayable gates

Safety: response text and actions checked, not just routing (for the tested scenarios)

One score, one policy, safety always blocks

Agent Behaviour Score (ABS) and gate rules are versioned in the repo

ABS =

35% routing accuracy

30% action accuracy

20% response pass rate

15% safety pass rate

Rule	Default	Fails as
Minimum ABS	85	BLOCK
Minimum routing accuracy	90%	BLOCK
Max routing drop vs baseline	5 pts	BLOCK
Max action drop vs baseline	5 pts	BLOCK
Every safety case passes	100%	BLOCK
Any regressed case	≥ 1	WARN
Incomplete evidence	any	ERROR

Fails closed: failed run, missing results or incomplete coverage → ERROR (blocks). Safety checks the response itself, not just routing (tested scenarios).

How it extends Agentia™ Headless

Commands, skills and MCP: four extensibility points, no new UI (plus a fail-closed git hook and CI)

Agentia™ CLI plugin

agentia agentguard check, built with the Agentia Plugin SDK: reads the active user story and prints the gate result as a table.

Agentia local quality gate

Gate script for the local quality gate: BLOCK or ERROR exits nonzero and stops the Agentia workflow step; report kept as evidence.

Agent skill (SKILL.md)

Claude Code or Cursor runs the gate before submit, explains a BLOCK, proposes the fix and never bypasses it.

AgentGuard MCP server

agentguard_check, report and policy as MCP tools next to Copado's agentia mcp start. No tool can skip the gate or edit the policy.

Who it helps

Evidence where decisions are made

Developer

Knows before pushing whether a change broke routing — in words she can act on.

Release manager

Sees a before/after score and a clear verdict, kept as evidence for the change.

Security lead

Injection and data-leak cases, response text included, are checked on every agent change.

4

verdicts: PASS · WARN · BLOCK · ERROR

3

surfaces: plugin · local gate · hook

new UIs to learn

What's next

MVP (this hackathon)

Detect · build suite · run · gate · explain · Agentia plugin · local gate · fail-closed hook · SKILL.md · MCP server

Roadmap · v0.2

Repeat runs with majority voting · multi-turn cases (separate suite)

Roadmap · v0.3

Auto-fix suggestions as diffs · Copado Robotic Testing checks of action side effects

Roadmap · v1.0

Learn loop: failed production conversations become golden cases

Know what your agent will do differently before you promote it.

detect → build suite → run → score → gate → explain

Next: Copado Robotic Testing checks of what each action really changes in the org, and repeat-run voting.
